

Feasibility-Constrained Forecast-to-Plan Framework

The same feasibility scoring layer evaluates every candidate strategy before deployment ranking.

Layer 1

Layer 2

Layer 3

Layer 4

Candidate forecasts and policies

- Demand history and context
- Accuracy-first candidates
- Ensemble and smoothing policies
- Greedy, DP, and budgeted-DP selectors

Forecast-to-plan conversion

- Forecasts become planning signals
- Inventory targets are generated
- Previous executed plan is retained
- Policy and cadence constraints apply

Feasibility scoring layer

- WAPE remains diagnostic
- Inventory exposure
- Planning volatility and switching burden
- Execution violation and PEG rate
- Normalized planning loss

Decision and validation layer

- Deployable strategy ranking
- DataCo execution-risk scenarios
- DP-oracle and perfect-demand references
- Favorita, M5, and Walmart validation
- Planning recommendations

Interpretation: forecast accuracy is reported separately, while deployment decisions are governed by feasibility-adjusted planning utility.
